OF SPECIFIED RADIATION EFFICIENCIES
FOR
VALCOM 85 FOOT POLE WITH VALCOSPHERE
OVER THE RANGE OF 1200 KHZ TO 1390 KHZ
AND
VALCOM 75 FOOT POLE WITH VALCOSPHERE
OVER THE RANGE OF 1390 KHZ TO 1700 KHZ**

ENGINEERING STATEMENT

The engineering exhibit of which this statement is part has been prepared to present and show the analysis of field strength measurements that were made to determine the radiation efficiency of an 85-foot pole transmitting antenna manufactured by the Valcom Manufacturing Group, Ltd. [“the manufacturer”] on 1200 KHz and 1390 KHz and for a 75-foot pole transmitting antenna of like construction on 1390 KHz and 1700 KHz. The field strength measurement results were used to calculate unattenuated radiation efficiencies at 10 KHz increments between 1200 KHz and 1390 KHz for the 85-foot model and between 1390 KHz and 1700 KHz for the 75-foot model.

The test measurements were made on each model pole during daytime hours with a power input of 250 watts from a test transmitter site beside the manufacturer’s factory in Guelph, Ontario. The antenna under test consisted in each case of the manufacturer’s standard pole with a “Valcosphere” (a wire-framed sphere) at the top and coil-loading centered approximately 1/3 of the total height above its base. The location was situated near the center of a 300 foot by 400 foot field and employed 120 buried copper wire ground radials that were each 120 feet in length. The operation was supervised, and the field strength measurements were made, by members of the manufacturer’s engineering staff.

The 1200 KHz field strength measurements were made in November and early December of 2005 and the 1390 KHz and 1700 KHz measurements were made in late October and November of 2006 to ensure that all were subject to similar environmental conditions. The power was maintained at the 250-watt level using the direct method of power determination that is described in Section 73.51 of the Federal Communications Commission’s Rules. Details regarding the antenna input resistance and input current measurements are in the possession of the manufacturer. The field strength measurements were made using a Potomac Instruments type FIM-41 field strength meter at locations chosen to conform as closely to the recommendations of Section 73.186 of the Federal Communications Commission’s Rules as practicable – considering the physical characteristics of the terrain surrounding the transmitter site - using topographic maps with the assistance of a GPS receiver that was programmed to have its reference point at the transmitter site.

As it was impossible to space the radials evenly due to nearby terrain characteristics, a total of seven radials were measured instead of the six that are required as a minimum by Section 73.186 of the Rules. The maps showing the measurement locations are in the possession of the manufacturer.

Figure 1 is a tabulation of the 1200 KHz field strength measurement data for the 85-foot pole and Figure 2 shows its graphical analysis. Figure 3 is a tabulation of the 1390 KHz field strength measurement data for the 85-foot pole while Figure 4 shows its graphical analysis. Figure 5 is a tabulation of the 1390 KHz field strength measurement data for the 75-foot pole and its graphical analysis is shown in Figure 6. Figure 7 is a tabulation of the 1700 KHz field strength measurement data for the 75-foot pole while Figure 8 shows its graphical analysis.

The field strength measurements were analyzed in accordance with the “best fit” method outlined in Section 73.186 of the Federal Communications Commission’s Rules, using Graphs 15, 17 and 20 of Section 73.184 to determine the ground conductivity values of the measurements at 1200 KHz, 1390 KHz and 1700 KHz, respectively. The measurement data indicate that the 85-foot Valcom pole produced unattenuated field strength levels at 1200 KHz and 1390 KHz of 141 mV/M and 144.6 mV/M at one kilometer, respectively, and that the 75-foot Valcom pole produced values of 141.6 mV/M and 146.4 mV/M at 1390 KHz and 1700 KHz with 250 watts input power. The analyzed ground conductivity values agree well on a radial-to-radial basis – with variations among the different frequencies falling within the normally expected range considering the non-homogenous nature of “real world” soil - and unambiguously support the analyzed antenna efficiencies.

The observed 141 mV/M and 144.6 mV/M unattenuated field levels for the 85-foot Valcom pole with 250 watts input power correspond to 1 KW values of 282 mV/M and 289.2 mV/M at 1200 KHz and 1390 KHz, respectively, while the observed values of 141.6 mV/M and 146.4 mV/M correspond to 1KW values of 283.2 mV/M and 292.8 mV/M for the 75-foot model at 1390 KHz and 1700 KHz. Figure 9 is a tabulation of calculated radiation efficiency values at 10 KHz increments that are based on these measured values.

The dimensions and pertinent characteristics of the 85-foot and 75-foot Valcom pole antennas that were tested appear in Figures 10 and 11, respectively. Figure 12 is a sketch of the ground system.

The observed unattenuated field values of Valcom poles exceed those shown for their physical heights on the graph which appears as Figure 8 of Section 73.190 of the FCC Rules. Two aspects of their design are responsible for this, their Valcosphere top-loading and their loading coils that are situated far enough above ground to reduce the antenna-to ground voltage in the base region which, in turn, reduces dielectric losses in the nearby soil. The effects lead to antenna efficiency improvements that are predictable and measurable.

The use of the physical heights of Valcom pole antennas to calculate their vertical radiation characteristics, as is done for conventional tower antennas, has previously been approved by the FCC based on a theoretical study prepared by the undersigned. [See Attachment A.] The field strength measurement data contained herein demonstrate that their radiation efficiency values can be known before they are constructed, within the frequency bands that were studied, and that proof-of-performance measurements after construction therefore are not necessary when they are used on frequencies within these ranges. It is requested that the FCC approve the unattenuated radiation values shown in the tabulation of Figure 9 for construction permit applicants proposing Valcom pole antennas in place of the values shown for their physical heights on Figure 8 of Section 73.190 of the FCC Rules.

ELECTRICAL CHARACTERISTICS

RESONANT FREQUENCY (f_0)	540 - 1700 KHZ (SPECIFIED BY CUST)
POWER RATING	2 KW FOR FREQ OF 540 - 790 KHZ 4 KW FOR FREQ OF 800 - 1090 KHZ 6 KW FOR FREQ OF 1100 - 1390 KHZ 10 KW FOR FREQ OF 1400 - 1700 KHZ
DRY WITHSTANDING VOLTAGE	30 KV
ELECTRICAL LENGTH	DEPENDANT ON f_0
POSITION OF LOADING COIL	2ND SECTION
OPERATING FREQUENCY	SPECIFIED BY CUSTOMER
INPUT IMPEDANCE AT f_0	DEPENDANT ON f_0
Q AT OPERATING FREQUENCY	DEPENDANT ON f_0

MECHANICAL CHARACTERISTICS

MECHANICAL LENGTH	85 FT (25.9 M)
VALCOSPHERE	32 IN (81.3 CM) DIA
ANTENNA MATERIAL	FILAMENT WOUND EPOXY/FIBREGLASS
TOP TERMINATION	VALCOSPHERE
JOINTS	BRONZE FERRULE C/W LOCKING PIN
WIND LOADING TEST	170 MPH (272 KPH)
TEMPERATURE	-60°F TO 150°F (-50°C TO 65°C)
FINISH	EPOXY POLYAMIDE PAINT
COLOUR	WHITE, OTHER COLOURS AVAILABLE
WEIGHT	950 LBS (432 KG) MAX

NOTES:

1. THE ADVANTAGE OF A CENTRE LOADING COIL IS A REDUCED RESONANCE OVER THAT OF A STRAIGHT 1/4-WAVE WHIP WHICH REDUCES BASE FEED IMPEDANCE AND VOLTAGE, THEREFORE PROVIDING AND GREATER POWER HANDLING CAPABILITY.
2. DO NOT USE LEAD BASE PAINT TO TOUCH-UP OR REPAINT ANTENNA.

ATTACHMENT A

FCC OET Memorandum

May 1, 2003

MAY 1 242 PM '00 memorandum

DATE: May 1, 2003

REPLY TO

ATTN OF: Robert Bromery, Chief
Electromagnetic Compatibility Division, OET RM/B

SUBJECT: F(theta) Formula for Valcom Antennas

TO: Edward P. De La Hunt, Assistant Chief,
Audio Services Division, Mass Media Bureau

We recommend that the formula given in Section 73.160(b) of FCC Rules for a "typical tower which is not top-loaded or sectionalized" should be used to represent the vertical plane radiation characteristics of the electrically short antennas manufactured by Valcom, Ltd. in the AM broadcast band. Our recommendation is based on a thorough study of the factors affecting radiation in the vertical plane of electrically short antennas in general and the Valcom, Ltd. Antenna in particular.

Valcom, Ltd. and several engineering consulting firms asked OET to identify an accurate f(theta) formula for electrically short Valcom antennas and to provide a derivation of the formula per Section 73.160(c) of FCC Rules. A study of this matter, attached, is our response to these requests. We find:

- The vertical radiation pattern of electrically short vertical monopole antennas is virtually independent of current distribution along the radiating element.
- The standard 49, 74 and 112-foot Valcom Ltd. Antennas meet this electrically short criterion at all frequencies of the AM broadcast band.
- The formula given as 73.160(b)(1) in FCC Rules accurately represents Valcom Ltd. antennas as well as the ideal simple vertical monopole for which it was originally derived.

If you have any questions in this matter, please contact Nam Pham at 418-2438, or Ronald Chase at 418-1378.

Robert Bromery
